RE: Health Risk Assessment for Diesel Exhaust from vehicular sources (primarily delivery trucks) associated with the Proposed The Commons at Quartz Hill;

Northwest Corner of 60th Street West and West Avenue L
Lancaster, California

PROJECT: 75013/6

EXECUTIVE SUMMARY

Kleinfelder West, Inc. (Kleinfelder) conducted a health risk assessment (HRA) to evaluate the impacts of annual average diesel exhaust emissions from vehicular sources (specifically heavy-duty, diesel delivery trucks) associated with the proposed The Commons at Quartz Hill project development (CQH), to be located at the northwest corner of 60th Street West and West Avenue L in Lancaster, California.

The proposed project is an approximately 353,129 square foot commercial development to be located on approximately 40 acres of primarily undeveloped land. Using delivery truck traffic estimates provided by the project proponent, Kleinfelder evaluated the health risk associated with diesel emission from heavy-duty delivery trucks. An air quality dispersion model was used to estimate potential diesel concentrations at residential, workplace and sensitive receptors surrounding the proposed site. The estimated maximum cancer and non-cancer health impacts at each of the corresponding receptor types are summarized as follows:

Maximum Exposed Individual RESIDENT (MEIR)

UTM Coordinates: (386366.09, 3836129.00)

Approximately 27 meters west of western property boundary, and approximately 53 meters east of the north Walmart loading dock area. Zoned for residential, but not yet developed.

Inhalation Cancer Risk:	3 in one million
Chronic Non-cancer Hazard Index (HI):	<0.01

Maximum Exposed Individual RESIDENT (MEIR)--DEVELOPED

UTM Coordinates: (386809.19, 3836075.00)

Approximately 40 meters east of the eastern property boundary, across 60th Street West. Existing residential area.

Inhalation Cancer Risk:	3 in one million
Chronic Non-cancer Hazard Index (HI):	<0.01

Maximum Exposed Individual WORKER (MEIW)

(Faculty or Workers at Quartz Hill High School)

UTM Coordinates: (386695.00, 3835733.00)

Approximately 141 meters south of the southern boundary of The Commons at Quartz Hill, across West Avenue L.

Inhalation Cancer Risk:	0.9 in one million **
Chronic Non-cancer Hazard Index (HI):	<0.01 **

Maximum Exposed SENSITIVE RECEPTOR

(Students at Quartz Hill High School)

UTM Coordinates: (386695.00, 3835733.00)

Approximately 141 meters south of the southern boundary of The Commons at Quartz Hill, across West Avenue L.

Inhalation Cancer Risk:	0.9 in one million **
Chronic Non-cancer Hazard Index (HI):	<0.01 **

** The indicated cancer risks and HI values are calculated using unadjusted annual average concentrations (as delivery hours could take place at any time of day). Furthermore, for simplification, the reported cancer risks are based on 70-year exposures (same as for MEIR).

The potential inhalation cancer risks are lower than the "range of relative excess cancer risk for residents along freeways or busy roadways of approximately 300-1,700 in one million" cited in a California Air Resources Board (CARB) study (CARB, 2005). The same study "estimated regional cancer risk from air toxics in the Los Angeles region (South Coast Air Basin) is approximately 1,000 in a million (CARB, 2005)." The potential chronic HI is well below the significance level of one (1).

INTRODUCTION

Kleinfelder, Inc. was retained by Christopher A. Joseph and Associates (CAJA) to perform an HRA for the proposed project, the The Commons at Quartz Hill Site, to be located at the northwest corner of 60th Street West and West Avenue L in Lancaster, California (see Figure 1 of Attachment A). This HRA was limited to impacts of annual average diesel exhaust emissions from vehicular sources operating onsite (specifically, heavy-duty, diesel delivery trucks) and associated with the proposed project.

The proposed project consists of a 353,129 square foot commercial development located on approximately 40.15 acres of primarily undeveloped land. As part of the proposed project, a General Plan Amendment (GPA 06-04) and a Zone Change (ZC 06-04) would be required in order to change the general plan designation from Urban Residential to Commercial (C) and the zoning from Urban Residential to Commercial and its zoning from residential (R-10,000) to commercial planned development (CPD). A Conditional Use Permit (CUP 06-09) would also be required for the proposed project. The commercial development would include two anchors and up to ten smaller buildings that would house a variety of food, merchandise and service uses. One proposed anchor is a Wal-Mart Supercenter, approximately 240,000 square feet with an associated garden center. The other anchor is anticipated to be approximately 90,000 square feet. A total of 1,837 parking spaces are anticipated to be provided and access to the project site would occur from 60th Street West and Avenue L. The project proponent anticipates that a portion of the goods delivered to the two anchors, one of which is a Wal-Mart Supercenter, will occur via diesel-fueled, heavy duty trucks (HHDTs). The onsite operations and emissions from these vehicles are the subject of this HRA.

The following sections of this technical memorandum are common to most HRAs and seek to provide the reader with a thorough understanding of the methodology used to characterize risk at the proposed project site: Hazard Identification, Exposure Assessment, Dose-Response, Risk Characterization, Assumptions and Limitations.

HAZARD IDENTIFICATION

The hazard identification involves identifying if a hazard exists, and if so, what are the pollutants of concern and their associated potential adverse health effects. In this HRA, the primary hazard are emissions from vehicular sources (specifically heavy-duty, diesel delivery trucks) associated with the proposed project. The State of California has identified diesel exhaust as a toxic air contaminant. The potential adverse health effects from exposure to diesel exhaust include inhalation cancer and chronic non-cancer effects.

It is important to note that the potential cancer risk from inhalation exposure to diesel exhaust usually outweighs the multipathway cancer risk from the speciated compounds. Likewise, the non-cancer health impacts from inhalation exposure to diesel exhaust usually outweighs the non-cancer multipathway health impacts from the speciated compounds of diesel exhaust (OEHHA, 2003). Therefore, only the inhalation cancer and chronic non-cancer effects of diesel exhaust were evaluated in this HRA.

Currently, there is no acute toxicity factor for diesel exhaust. Therefore, potential acute (short-term) non-cancer health effects were not evaluated in the HRA.

EXPOSURE ASSESSMENT

The exposure assessment estimates the extent of exposure to diesel exhaust for which potential cancer and chronic non-cancer effects will be evaluated. This involved emission quantification, dispersion modeling, and estimation of long-term exposure levels.

The diesel exhaust emissions quantification required a diesel exhaust emission rate from HHDTs associated with the project. The annual average diesel exhaust emissions have been used to evaluate the potential chronic (long-term) cancer and non-cancer health impacts at receptors surrounding the project. We did not estimate the maximum hourly diesel emissions because, currently, there is no acute toxicity factor for diesel exhaust. Therefore, potential acute (short-term) non-cancer health impacts have not been evaluated in this HRA.

The surrogate for diesel exhaust is diesel PM or PM_{10} (particulate matter, ten microns or less in size). A diesel exhaust (as PM_{10}) emission rate of 0.67 grams per mile (g/mi) was obtained from an appropriate guidance document (San Joaquin Valley Air Pollution Control District [SJVAPCD], 2006). The appropriateness of this value was confirmed through two runs using the EMFAC2007 model. The first of these runs yielded a value

of 0.86 g/mi, conservatively based upon the anticipated distribution of HHDTs registered in Los Angeles County ranging from model years 1965 through reporting year 2009. The less conservative second run yielded a value of 0.56 g/mi, based on a more limited model year range of 11 years—1999 through reporting year 2009.

The only stores that are anticipated to receive freight from HHDTs are the Wal-Mart Supercenter and the Major 2 anchor. The project proponent anticipates Wal-Mart to have 4-5 semi-type trucks delivering each day (5 semi-type trucks per day was used in calculations), including dry groceries, general merchandise, and fresh produce/deli/meats (via a transportation refrigerated unit [TRU]). Additionally, the Major 2 is expected to have approximately 3 truck deliveries per week (0.5 semi-type trucks per day was used in calculations). The outparcels would likely require less than 2 deliveries per day, the majority of which will be smaller trucks than the HHDTs that will be utilized for the Wal-Mart deliveries. Only the semi-type trucks were used in this analysis; furthermore, they were assumed to be heavy-duty, diesel trucks (HHDT). The HHDTs are anticipated to enter via a driveway along West Avenue L across from the existing Quartz Hill High School and proceed north toward the loading docks located behind the two major stores (see Figure 2 of Attachment A).

One point source was placed at each of three loading docks (two at the Wal-Mart Supercenter, and one at Major 2), to model emissions from idling HHDTs. The truck idling calculations were based on a total idling time of 5 minutes per truck, the recommended maximum idling time under the related California Air Resources Board (CARB) Airborne Toxic Control Measure (ATCM). One additional point source was located alongside each of the two Wal-Mart Supercenter idling point sources to allow for the modeling of emissions from TRU emissions. The TRU calculations were based on a delivery time of 30 minutes per truck, and assuming a worst case of two trucks per day. The idling and TRU emission factor and physical modeling parameters were obtained from the aforementioned SJVAPCD modeling guidance document (SJVAPCD, 2006).

Upon unloading, trucks are anticipated to exit the CQH project via the same driveway located along West Avenue L (see Figure 2 of Attachment A). It is assumed that trucks will maintain a speed limit of less than 15 miles per hour within the project property boundaries.

Dispersion modeling was performed using the Breeze ISC GIS Pro Version 5.2.1 version of the US EPA's Industrial Source Complex—Short Term, Release 3 (ISCST3) model (Version 02035) to estimate the ground-level diesel concentrations based on the emission rates discussed above. The modeled truck route was approximated using 100 volume sources along its length. The calculated emission rates for different portions of

the truck route was divided amongst the appropriate number of volume sources to determine an emission rate input in unts of grams per second per volume source. A summary of the emissions calculations discussed above are provided in Tables 1a and 1b of Attachment B.

The modeling estimated ground-level diesel concentrations at 470 receptors distributed via 50-meter Cartesian grid of receptors (for residential and workplace receptors) extending at least 400 meters from the CQH property boundaries in all directions. Additionally, discrete receptors were placed at the location of two identified sensitive locations—Quartz Hill High School at 6040 W. Avenue L, and Joe Walker Middle School at 5632 West Ave L-8—both located within several blocks of the proposed project. All source and receptor locations were approximated using Universal Transverse Mercator (UTM) coordinates. The source and receptor locations are respectively presented in Figures 2 and 3 of Attachment A, and contained in the modeling file outputs provided as Attachment C.

The modeling utilized pre-processed meteorological data for upper air station 99999 and surface meteorological station 51117 (both for Lancaster, CA) obtained from the South Coast Air Quality Management District's (SCAQMD) website (http://www.aqmd.gov/smog/metdata/MeteorologicalData.html). The model was run using SCAQMD defaults with "RURAL" dispersion coefficients. No building profile algorithms were used and no terrain was specified (assumed "FLAT" terrain, with ground-level receptors). Additional input parameters are summarized in the modeling output file provided in Attachment C.

Using the modeling approach and methodology discussed above, the maximum annual average ground-level diesel concentration was estimated to be 0.01000 micrograms per cubic meter ($\mu g/m^3$). The maximum value occurred approximately 27 meters west of the western property boundary and approximately 53 meters east of the north Walmart loading dock area (UTM coordinate: [386366.09, 3836129.00]) , as shown in the modeling output file provided in Attachment C. This area is currently zoned for residential, but is not yet developed. A summary of the modeling results are presented in Table 2 of Attachment B.

DOSE-RESPONSE

The dose-response assessment is the process of characterizing the relationship between exposure to diesel exhaust and incidence of an adverse health effect in exposed populations.

The estimation of potential inhalation cancer risk posed by exposure to diesel exhaust requires a cancer potency factor. Cancer potency factors are expressed as the upper bound probability of developing cancer assuming continuous lifetime exposure to diesel exhaust at a dose of one milligram per kilogram of body weight, and are expressed in units of inverse dose as a potency slope (i.e., $[mg/kg/day]^{-1}$). A cancer potency factor when multiplied by the dose of a carcinogen gives the associated lifetime cancer risk. The cancer potency factor for diesel exhaust is 1.1×10^{0} $[mg/kg/day]^{-1}$ (OEHHA, 2003).

The estimation of potential inhalation chronic non-cancer effects posed by exposure to diesel exhaust requires a chronic reference exposure level (REL). A chronic REL is a concentration level (that is expressed in units of micrograms per cubic meter ($\mu g/m^3$) for inhalation exposures), at or below which no adverse health effects are anticipated following long-term exposure. The chronic REL for diesel exhaust is 5 $\mu g/m^3$ (OEHHA, 2003). The chronic hazard index target organ for diesel exhaust is the respiratory system (OEHHA, 2003).

Currently, there is no acute toxicity factor for diesel exhaust. Therefore, potential acute (short-term) non-cancer health effects were not evaluated in the HRA.

RISK CHARACTERIZATION

Risk characterization combines the maximum annual average ground-level diesel concentration from the exposure assessment and the cancer potency factor and chronic REL from the dose-response analysis to estimate the potential inhalation cancer risk and chronic HI from the exposure to diesel exhaust emissions.

The following calculation was performed to estimate exposure through inhalation as a function of respiration rate and the concentration of diesel exhaust in air (OEHHA, 2003, Equation 5.4.1 A)(the recommended default values are also provided):

$$\text{Dose-inh} = [C_{air} * \{DBR\} * A * EF * ED * 10^{-6}] / AT$$
$$= [0.01000 * 271 * 1 * 350 * 70 * 10^{-6}] / 25{,}550$$
$$= 0.00000260 \text{ mg/kg/d}$$

where:

Dose-inh = Dose through inhalation (mg/kg/day)

10^{-6} = Micrograms to milligrams conversion, Liters to cubic meters conversion.

C_{air} = Concentration of diesel exhaust in air ($\mu g/m^3$)
= 0.01662 (residential)

{DBR} = Daily breathing rate (L/kg body weight - day)
= 271 (70-year "average" value, residential)

A = Inhalation absorption factor
= 1

EF = Exposure frequency (days/year)
= 350 (residential)

ED = Exposure duration (years)
= 70 (residential)

AT = Averaging time period over which exposure is averaged, in days (e.g., 25,550 days for 70 yr for cancer risk)
= 25,550 (residential)

The following calculation was performed to estimate the excess cancer risk for a 70-year resident due to diesel exhaust from the proposed project, based upon the calculated dosage:

Inhalation Cancer Risk

= (Dose-inh, mg/kg/day) x (Cancer Potency Value, $[mg/kg/day]^{-1}$)

= $0.00000260 \times 1.1 \times 10^{0}$

= 2.86×10^{-6}

= 3 in one million (MEIR)

Because the MEIR calculated above occurred in an undeveloped area zoned residential, the maximum annual concentration for a currently developed residential area was also evaluated. This value, also 3 in one million, occurred at a receptor located approximately 40 meters east of the eastern property boundary, across 60th Street West. A summary of modeling results is provided in Table 2 of Attachment B.

Similarly, the inhalation cancer risks at both the MEIW and maximum sensitive receptor were calculated as 0.9 in one million (see Table 2 of Attachment B). Please refer to Figure 3 of Attachment A for the approximate locations of the MEIR, MEIW and maximum sensitive receptor.

The chronic HI is a calculated ratio. Exposures above the REL are indicated by an HI greater than one (1) and may indicate that the source has a potential to cause adverse non-cancer health effects.

Chronic Non-Cancer HI

= (annual average diesel exhaust concentration, $\mu g/m^3$) / REL

= (0.01000 $\mu g/m^3$) / (5 $\mu g/m^3$)

= 0.00200 (or <0.01) (MEIR)

Similarly, the chronic non-cancer HI at both the MEIW and maximum sensitive receptor were calculated to be less than 0.01 (see Table 2 of Attachment B). Please refer to Figure 3 of Attachment A for the approximate locations of the MEIR, MEIW and maximum sensitive receptor.

For purposes of a cumulative analysis, the anticipated diesel emissions from the proposed commercial development project immediately southeast of the subject property (Lane Ranch Towne Center) was incorporated in the modeling.

Cancer Risk—Cumulative

The cumulative analysis showed that the receptor location of the MEIR did not change and the cancer risk remained 3 in one million (see Table 2 of Attachment B). The MEIW was only evaluated for faculty and staff of surrounding schools, as values compiled for the receptors on the two development sites were not considered. An MEIW and maximum sensitive receptor cancer risk of 1 in one million was calculated using an annual average concentration of 0.00326 $\mu g/m^3$ from Quartz Hill High School discrete receptor B (UTM Coordinates: [386695, 3835733]). Again, the MEIW and sensitive receptor cancer risks are conservatively high as they have been estimated using a 70-year exposure.

Chronic Non-Cancer HI—Cumulative

The cumulative chronic non-cancer HI is well below 0.01 (<0.01) (see Table 2 of Attachment B).

COMPARISONS

The results compiled in the prior sections were compared to a couple of recent literature sources. The *Proposed Air Quality and Land Use Handbook: A Community Health Perspective*, prepared by CARB and dated March 2005 indicated a range of relative excess cancer risk for residents along freeways or busy roadways of approximately 300-1,700 in one million. The estimated regional cancer risk from air toxics in the Los Angeles region (South Coast Air Basin) is approximately 1,000 in a million (CARB, 2005)."

In another document, *The California Almanac of Emissions and Air Quality - 2006 Edition*, a table of annual health risk indicate an average basin risk for nine toxic air contaminants (other than diesel exhaust) of approximately 187 in a million in 2004, down from 285 in a million in 2000 (both based on monitoring data). From the same table, the most recent diesel exhaust risk estimate is for year 2000, is based on modeling techniques, and was estimated to be 720 in a million (CARB, 2006). Another study conducted by the SCAQMD called the Multiple Air Toxics Exposure Study (MATES-II) arrived at a regional cancer risk of approximately 1,400 in a million, based primarily on air toxics monitoring data, of which approximately 70% was attributed to diesel exhaust (SCAQMD, 2000).

ASSUMPTIONS

Anticipated truck count information was provided by the project proponent, or its representative, through CAJA. It does not include smaller delivery vehicles (or vans), vendor trucks, priority delivery trips (e.g. FedEx/UPS), and other sporadic deliveries.

Only emissions from HHDTs were calculated and modeled in this analysis. Medium- and light-duty delivery traffic was not considered in this analysis.

The only stores that are anticipated to receive freight from HHDTs are the Wal-Mart Supercenter and the adjacent Major 2 anchor. The HHDTs are anticipated to enter a driveway along West Avenue L across from the existing Quartz Hill High School and proceed north toward the loading docks located behind the two major stores. It is anticipated that the trucks will exit via the same driveway. 5.5 HHDTs will deliver freight

to these stores on a daily basis; no other HHDT deliveries were provided by CAJA or the project proponents.

Used emission factors and exhaust flow characteristics recommended in the SJVAPCD's Guidance for Air Dispersion Modeling (dated September 2006). Including Section 2.3 (Mobile/Non-Permitted Sources), and Sub-sections 2.3.1 (Transportation Refrigeration Unit [TRU]) and 2.3.2 (Truck Traveling and Idling).

One point source was placed at each of three loading docks (two at the Wal-Mart Supercenter, and one at Major 2), to model emissions from idling HHDTs. The truck idling calculations were based on a total idling time of 5 minutes per truck, the recommended maximum idling time under the related California Air Resources Board (CARB) Airborne Toxic Control Measure (ATCM).

One additional point source was located alongside each of the two Wal-Mart Supercenter idling point sources to allow for the modeling of emissions from diesel-fired TRU emissions. The TRU calculations were based on a delivery time of 30 minutes per truck, and assuming a worst case of two trucks per day.

A 50-meter spaced Cartesian grid was used in areas of both current and anticipated residential development within approximately one-quarter mile of the project site. Readily available aerial photographs and land use information contained in the "Westside" map of the City of Lancaster's community development department was used as a resource for this task.

For purposes of the cumulative analysis, the anticipated diesel emissions from the proposed commercial development project immediately southeast of the proposed project (Lane Ranch Towne Center) was also modeled.

LIMITATIONS

The above analysis is preliminary and is based on a number of assumptions. In addition, the cumulative analysis that was performed does not account for all possible sources/pollutants. No consideration of existing background concentrations, other than discussion of the results of past studies, has been included. However, traditionally, when assessing a specific project, background concentrations are not included.

This report was prepared in general accordance with the accepted industry standard at the time the report was written. The results contained in this report are based upon the information acquired at the time of the investigation. It is possible that not all conditions

were identified during this project. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time.

It should be recognized that identifying and assessing possible environmental, health and safety issues and regulatory requirements is challenging. Judgments leading to conclusions and recommendations are generally made with an incomplete knowledge of the facility. Kleinfelder should be notified for additional consultation if the client wishes to reduce the uncertainties beyond the level associated with this report. It should be recognized that the scope of work described herein is not intended to be inclusive, to identify all potential concerns, or to eliminate the possibility of problems. No warranty or guarantee, expressed or implied, is made.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance. Land or facility use, on and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Any party other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party.

Heavy-duty, diesel	2.57	5	5	365	25	0.4	152.0833333	3.91E+02	1.24E-05	6.20E-06

Diesel PM Emissions from Trucks Idling on The Commons at Quartz Hill Property (1 Point Sources--Major 2 Loading Dock)

	EF[(2)]	Truck Idling and Facility Operational Assumptions			Calculated Idling Time			Calculated Annual Average Emissions		
Truck Type	g/hr	trucks/day	min/truck	days/yr	min/day	hrs/day	hrs/yr	g/yr	g/s	g/s/pt src
Heavy-duty, diesel	2.57	0.5	5	365	2.5	0.0	15.20833333	3.91E+01	1.24E-06	1.24E-06

Diesel PM Emissions from Transportation Refrigeration Units (TRUs) on The Commons at Quartz Hill Property (2 Point Sources--2 Wal-Mart Loading Docks)

	EF[(2)]	Transportation Refrigeration Unit (TRU)			Calculated Idling Time			Calculated Annual Average Emissions		
Truck Type	g/hr	trucks/day	min/truck	days/yr	min/day	hrs/day	hrs/yr	g/yr	g/s	g/s/pt src
Heavy-duty, diesel	38	2	30	365	60	1.0	365	1.39E+04	4.40E-04	2.20E-04

Notes:

[(2)] = Data obtained from Sections 2.3.1 ("Transportation Refrigeration Unit (TRU)") and 2.3.2 ("Truck Traveling and Idling"). SJVAPCD's "Guidance for Air Dispersion Modeling", Rev. 1.2 dated 08/06.

g/hr = grams per hour
hrs/yr = hours per year
min/truck = minutes per truck
g/s/pt src = grams per second per point source (calculated, based on the specified number of point sources)

TABLE 2
Summary of Results
Health Risk Analysis
Proposed The Commons at Quartz Hill
Lancaster, California

Draft

Model Run ID	Receptor Description	Coordinates	Maximum Annual Concentration ($\mu g/m^3$)	Inhalation Dose (mg/kg/day)	Inhalation Cancer Risk, using dose	Non-cancer Chronic Hazard Index (HI)	Notes

CONC RURAL FLAT DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

- -

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  -- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.
           8. "Upper Bound" Values for Supersquat Buildings.
           9. No Exponential Decay for RURAL Mode

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates ANNUAL Averages Only

**This Run Includes: 105 Source(s);   1 Source Group(s); and   487 Receptor(s)

**The Model Assumes A Pollutant Type of: OTHER

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs: Anem. Hgt. (m) =   10.00 ;   Decay Coef. =   0.0000 ;   Rot. Angle =   0.0
                 Emission Units = GRAMS/SEC   ; Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =   1.3 MB of RAM.

**Input Runstream File: C:\CAJAMO~1\COMMONS\COMMONS_ISC003.DAT
**Output Print File: C:\CAJAMO~1\COMMONS\COMMONS_ISC003.LST

CONC RURAL FLAT DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

- -

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  -- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.
           8. "Upper Bound" Values for Supersquat Buildings.
           9. No Exponential Decay for RURAL Mode

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates ANNUAL Averages Only

**This Run Includes: 298 Source(s);   1 Source Group(s); and   416 Receptor(s)

**The Model Assumes A Pollutant Type of: OTHER

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs: Anem. Hgt. (m) =   10.00 ;   Decay Coef. =   0.0000 ;   Rot. Angle =   0.0
                 Emission Units = GRAMS/SEC   ; Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =   1.5 MB of RAM.

**Input Runstream File: C:\CAJAMO~1\LRTC\GENERAL_ISC002.DAT
**Output Print File: C:\CAJAMO~1\LRTC\GENERAL_ISC002.LST
